

FIRE SAFETY TIPS FOR BLIND OR VISUALLY IMPAIRED PEOPLE

The following fire safety tips are organized in three sections: before the fire, during the fire, and fire prevention. While these tips represent many fire safety approaches, the use of smoke alarms and exit planning should be considered the most crucial. According to the U.S. Fire Administration, smoke alarms are the single most important piece of fire safety equipment in use today. Exit planning is also extremely important, especially for individuals who may have difficulty exiting a burning building.

These fire safety tips are reproduction ready. They may be used as education material by fire service, life safety, or health educators. Permission to reproduce them for that purpose is granted. Proper credit should be given to the United States Fire Administration and the Federal Emergency Management Agency.

Before the Fire

Identify the Nearest Emergency Exit. Whether you are at home or elsewhere, you should always know the location of the nearest exit. This could save your life in an emergency.

Install Smoke Alarms. A working smoke alarm can make a vital difference in the event of a fire; it has the potential to reduce the risk of death in a fatal fire by 60 percent. A properly functioning smoke alarm can alert you to the presence of deadly smoke while there is still time to escape. Place alarms next to each sleeping area and on every floor of your home. Test batteries monthly, and replace them annually. If you cannot do this yourself, ask a family member, neighbor, building manager, or someone from the fire department to assist you. Clean smoke alarms by vacuuming them regularly, or ask someone to do it for you. Install high-decibel smoke alarms to alert you to the presence of a fire. If your smoke alarms are hardwired (connected to the electric circuitry of your residence), make sure they are also equipped with battery backups.

Live Near an Exit. If you live in an apartment building or condominium, try to get a unit on the ground floor. If this is not possible, know where the exit stairwell is located and how to get there. Plan to wait there for help if you also have an impairment that prevents you from taking the stairs.

If you live in a multistory house, try to sleep on the ground floor. Make sure a phone is next to your bed within arm's reach along with emergency telephone numbers.

Plan and Practice Escape Plans. Knowing your escape plan is one of the most important steps you can take to save your life in a fire. Plan your escape around your capabilities. Know at least two exits from every room. Make sure you can unlock all your doors and windows. Be sure you know how to open your windows. If security devices, such as bars, are installed across the windows, ensure that they release from the inside.

Exit Indicators. The confusion and disorientation of a fire in the home can be difficult to overcome. You may be forced to crawl along the floor to avoid smoke. As it can be very disorienting to crawl where you are used to walking (especially if you count steps to locate doors and hallways), it is recommended that you place tactile markers along the baseboard of exit routes inside your home. These will help to identify where to go in case of a fire.

Involve the Fire Department. Ask the fire department to help you plan an escape route, and inform them of your special needs. Ask the fire department to help identify fire hazards in your home and explain how to correct them. Any areas you plan to use as a rescue area must be identified and agreed upon by you and officials from the fire department. Learn the fire department's limitations, and make fire officials aware of yours.

During the Fire

Get Out and Stay Out. Leave your home as soon as possible. Do not try to gather personal possessions or attempt to extinguish the fire. Do not use the elevator. Once out, **do not go back inside.**

Test the Doors Before Opening Them. Using the back of your hand, reach up high and touch the door, the doorknob, and the space between the door and the frame. If anything feels hot, keep the door shut and use your second exit. If everything feels cool, open the door slowly and crawl out low to the ground if smoke is present.

Stay Low and Go. Crawl low and keep under the smoke if you can. If not, try to cover your mouth and nose to avoid breathing toxic fumes and make your way to safety as quickly as possible.

What To Do If You Are Trapped. Close all the doors between you and the fire. Stuff cracks in doors and cover all vents with a damp cloth to the best of your ability to keep smoke out. If possible, call the fire department and tell them where you are located. Signal

rescuers from a window with a light-colored cloth that you keep in a predesignated place for this purpose.

Stop, Drop, and Roll. If any part of you catches fire, do not run and do not try to extinguish the flames with your hands. Cover your face with your hands. Drop to the ground, rolling over and over. If you have another disability preventing these actions, try to keep a flame-resistant blanket or rug nearby to smother any flames.

Fire Prevention

Cooking. Never leave the stove unattended while cooking. If you need to step away from the stove, turn it off. Wear tight-fitting clothing when cooking over an open flame, and keep towels and potholders away from the flame. If food or grease catches fire, smother the flames by sliding a lid over the pan and turning off the heat. Do not try to use water to extinguish a grease fire. When deep-frying, never fill the pan more than one-third full of oil or fat. Never put foil or other metals in the microwave. Make sure the stove is kept clean and free of grease buildup. Turn pot handles away from the front of the stove so they cannot be knocked off or pulled down.

Electrical Safety. Electric blankets should conform to the appropriate standards and have overheating protection. Do not wash blankets repeatedly as this can damage their electrical circuitry. If an appliance begins to smell suspicious or emit smoke, unplug it immediately. Replace all frayed or broken electrical cords. Never use an appliance with exposed wires. Never overload extension cords, and keep them out of traffic areas. Use only tested and UL-listed electrical appliances.

Smoking. Never smoke in bed. Make sure that you are alert when you smoke. If a gas stove or oxygen source is nearby, do not smoke. Place signs stating that oxygen is in use and warning visitors to refrain from smoking. Do not smoke while under the influence of alcohol or if you are taking prescription drugs that can cause drowsiness or confusion. Never leave smoking materials unat-

tended, and collect them in large, deep ashtrays. Check around furniture, especially upholstered furniture, for any discarded or smoldering smoking materials. Before discarding them, soak the materials in the ashtray.

Space Heaters. Give space heaters space. Keep heaters at least 3 feet from any combustible material, including people. Follow the manufacturers' directions regarding operation, fueling, and maintenance of your space heater. Do not use heaters or other heating devices to dry clothing.

Heating. Have your heating systems and chimneys checked and cleaned annually by a professional. Never store fuel for heating equipment in the home. Keep fuel outside or in a detached storage area or shed.

Fireplaces. Open fireplaces can be hazardous; they should be covered with tempered glass doors and guarded by a raised hearth 9 to 18 inches high.
